

Replicator Application Note

Corporate Data Protection

The Problem

Many corporations are spread apart geographically, but they still need a solution for centralized backup. How can they maintain local backup and archiving needs as well as a centralized backup solution without creating a giant administrative problem?

The Solution

Replicator servers placed at the remote locations can meet the needs of the local branches by handling all of their backup and archiving needs, while a centralized Replicator server at the administrative location can mirror the remote Replicators on a regular basis. This approach provides for off-site replication of data as well as local archiving.
