

Replicator Application Note

Companies with Heterogeneous Environments (Mac, Windows, Unix)

The Problem

Many times a company will have a heterogeneous environment because different machines excel at performing certain tasks. This presents a problem for typical backup solutions since most are geared toward a single platform. Mac software can back up only Macs, Windows software only Windows machines, etc. Is there a backup solution that will work in a heterogeneous environment that is easy to administer and provides straightforward data recovery?

The Solution

Replicator software can maintain mirrors of all of these types of machines without having to load any everStor supplied client software on them (some platforms may require a free third party utility). Replicator uses standard protocols that already exist on each of these platforms for ease of implementation. This provides an easy-to-administer backup site for all of a company's data. One machine can handle all of a company's backup needs, and at the same time can be configured to track changes to files for quick recovery of modified data.
