

Replicator Combined with Hiarc HSM

The Problem

Is there a way to gain all the benefits of a centralized, disk-based backup system without having to manage the expanding disk storage needs that such a system would entail?

The Solution

Replicator can be used in conjunction with Hiarc HSM to provide extended storage on the Replicator server without the headache of managing large, ever-expanding disk storage needs. Given that only about 10% of all data changes on a regular basis, the HSM provides a perfect solution to storing replicated data. Older data that has not changed recently is migrated to tape or optical storage. The data maintains availability, but no longer takes up room on the faster disk space.
