

Small Office Environment (Windows)

The Problem

Most small office environments do not have a backup, recovery or any data protection scheme because they can't commit one person to the full-time responsibility of the network and its data. How can data be protected without a full-time system administrator?

The Solution

By placing a Replicator server in this environment, a simple one-time setup will protect the data on this network by mirroring the information from the Windows machines and archiving any changes made to files. This gives users peace of mind providing them with an easy-to-use, browser-based recovery tool to retrieve files that have been accidentally corrupted or deleted. It also protects them from hardware failure by maintaining a copy of their data that can be restored onto a new system.
