

Webhosting Company

The Problem

Using today's high power Web server software, webhosters often hold 200 or more Web sites on a single machine. Reality dictates that failure will occur with even the most reliable hosts, and recovery time is **CRITICAL** to avoid losing customers. What is the easiest way to recovery when something does go wrong?

The Solution

Replicator provides a unique solution for this kind of recovery. As opposed to the typical backup-to-tape solution, which many times doesn't present its flaws until it's too late, Replicator maintains a mirror of the data that is accessible all the time through any Web browser anywhere in the world (given the correct authentication). The replication process is fast since it is essentially disk-to-disk backup, and restores are much faster and more complete. Since Replicator maintains a mirror at all times, there is no piecing together incremental backups. All of this helps restore machines faster and easier, which provides the best result — happy customers.
