

Question

I am connecting a tape library and an optical jukebox to the same computer; do I need two jb driver packages?

Answer

No, you only need one jb driver package. Our jb driver package only knows the SCSI II robotic command set. All the jb driver package cares about is that the robotics device listens and talks to the SCSI II compliant robotics instruction set, and that it can move media from one location to another upon command. The jb driver was designed to complement the existing programs that deal with recording devices.
