

Question

What is the benefit of Replicator?

Answer

Because Replicator is a flexible, robust, heterogeneous solution that can be connected to any IP-routable client, Replicator allows users to replicate your corporation's biggest asset: its data. Because it supports IP, Replicator allows users to replicate data from local or physically separated servers and workstations of any distance. The replicated data can be used for data availability during scheduled maintenance, remote backups, remote data analysis and even instantaneous end user access to replace accidentally deleted data.

With today's enterprise comprised of one or more networks that contain a wide range of devices, platforms and applications, Replicator should be a critical component of your company's sound disaster recovery program.
