

Question

What is meant by “no client software” or “no everStor supplied client software”?

Answer

Replicator uses industry standard protocols such as SMB and FTP to access and transfer data from client machines. In most cases these protocols are already configured and enabled by default, and thus no client software is necessary for Replicator to function. In a few cases one of these protocols is not installed or is disabled. To allow Replicator to replicate files from these machines, either a free, third-party utility is required or the service must be enabled.
